MATHEMATICS.

There will be two papers in Mathematics, one paper in Arithmetic and Algebra, and a second paper in Geometry.

The courses shall be as follows :—

(1) *Arithmetic*.—The whole of Arithmetic (The use of Algebraical symbols and processes will be permitted.)

(2) *Algebra*.—The four simple rules. Fractions, Greatest Common Measure, Least Common Multiple, Factors, Proportion, Simple Equations of one or more unknown quantities with easy problems, Square Root, simple questions on Fractional and Negative Indices, Quadratic Equations of one unknown quantity with easy problems, easy graphs.

(Candidates will be provided with squared paper.)

(3) *Geometry*.—The course includes both Practical and Theoretical Geometry, and every candidate will be expected to answer questions in both branches of the subject.

The questions on Practical Geometry will be set on the constructions contained in the annexed Schedule A, together with easy extensions of them. All figures should be drawn accurately, for which purpose every candidate should provide himself with a graduated scale, a pair of set squares, a protractor, a compass and a hard pencil.

The questions on Theoretical Geometry will consist of Theorems contained in the annexed Schedule B, together with easy extensions and deductions with numerical illustrations. Any proof of a proposition will be accepted which appears to the examiners to form part of a systematic treatment of the subject; the order in which the theorems are stated in Schedule B is not imposed as the sequence of their treatment. In the proof of the theorems hypothetical constructions will be permitted.

Schedule A.

Bisections of angles and of straight lines.

Construction of perpendiculars to straight lines.

Construction of an angle equal to a given angle.

Construction of parallels to a given straight line.

Simple cases of the construction from sufficient data of triangles and quadrilaterals.

Division of straight lines into a given number of equal parts or into parts in any given proportions.

Construction of a triangle equal in area to a given polygon.

Construction of tangents to a circle and of common tangents to two circles.

Simple cases of the construction of circles from sufficient data.

Construction of a fourth proportional to three given straight lines and a mean proportional to two given straight lines

Construction of regular figures of 3, 4, 6 or 8 sides in or about a given circle.

Construction of a square equal in area to a given polygon.

Schedule B.

ANGLES AT A POINT.

If a straight line stands on another straight line the sum of the two angles so formed is equal to two right angles; and the converse.

If two straight lines intersect, the vertically opposite angles are equal.

PARALLEL STRAIGHT LINES.

When a straight line cuts two other straight lines, if

(i) a pair of alternate angles are equal, or

(ii) a pair of corresponding angles are equal, or

(iii) a pair of interior angles on the same side of the cutting line are together equal to two right angles,

then the two straight lines are parallel; and the converse.

Straight lines which are parallel to the same straight line are parallel to one another.

TRIANGLES AND RECTILINEAR FIGURES.

The sum of the angles of a triangle is equal to two right angles.

If the sides of a convex polygon are produced in order the sum of the angles so formed is equal to four right angles.

If two triangles have two sides of the one equal to two sides of the other, each to each, and also the angles contained by these sides equal, the triangles are congruent.

If two triangles have two angles of the one equal to two angles of the other, each to each, and also one side of the one equal to the corresponding side of the other, the triangles are congruent.

If two sides of a triangle are equal, the angles opposite to these sides are equal; and the converse.

If two triangles have the three sides of the one equal to the three sides of the other, each to each, the triangles are congruent.

If two right-angled triangles have their hypotenuses equal, and one side of the one equal to one side of the other, the triangles are congruent.

If two sides of a triangle are unequal, the greater side has the greater angle opposite to it; and the converse.

Of all the straight lines that can be drawn to a given straight line from a given point outside it, the perpendicular is the shortest.

The opposite sides and angles of a parallelogram are equal; each diagonal bisects the parallelogram and the diagonals bisect one another.

If there are three or more parallel straight lines and the intercepts made by them on any straight line that cuts them are equal, then the corresponding intercepts on any other straight line that cuts them are also equal.

AREAS.

Parallelograms on the same or equal bases and of the same altitude are equal in area.

Triangles on the same or equal bases and of the same altitude are equal in area.

Equal triangles on the same or equal bases are of the same altitude.

Illustrations and explanations of the geometrical theorems corresponding to the following Algebraical identities:—

$$k(a+b+c+\dots) = ka+kb+kc+\dots$$

$$(a+b)^2 = a^2 + 2ab + b^2.$$

$$(a-b)^2 = a^2 - 2ab + b^2.$$

$$a^2 - b^2 = (a+b)(a-b).$$

The square on a side of a triangle is greater than, equal to, or less than, the sum of the squares on the other two sides according as the angle contained by those sides is obtuse, right, or acute. The difference in the case of inequality is twice the rectangle contained by one of the two sides and the projection on it of the other.

LOCUS.

The locus of a point which is equidistant from two fixed points is the perpendicular bisector of the straight line joining the two fixed points.

The locus of a point which is equidistant from two intersecting straight lines consists of the pair of straight lines which bisect the angles between the two given lines.

THE CIRCLE.

A straight line drawn from the centre of a circle to bisect a chord which is not the diameter is at right angles to the chord; conversely the perpendicular to a chord from the centre bisects the chord.

There is one circle, and one only, which passes through three given points not in a straight line.

In equal circle (or in the same circle) (i) if two arcs subtend equal angles at the centres, they are equal; (ii) conversely, if two arcs are equal, they subtend equal angles at the centres.

In equal circles (or in the same circle) (i) if two chords are equal, they cut off equal arcs; (ii) conversely, if two arcs are equal the chords of the arcs are equal.

Equal chords in a circle are equidistant from the centre; and the converse.

The tangents at any point of a circle and the radius through the point are perpendicular to one another.

If two circles touch, the point of contact lies on the straight line through the centres.

The angle which an arc of a circle subtends at the centre is double that which it subtends at any point on the remaining part of the circumference.

Angles in the same segment of a circle are equal; and if the line joining two points subtends equal angles at two other points on the same side of it, the four points lie on a circle.

The angle in a semi-circle is a right angle, the angle in a segment greater than a semi-circle is less than a right angle, and the angle in a segment less than a semi-circle is greater than a right angle.

The opposite angles of any quadrilateral inscribed in a circle are supplementary; and the converse.

If a straight line touch a circle, and from the point of contact a chord be drawn, the angles which this chord makes with the tangent are equal to the angles in the alternate segments.

If two chords of a circle intersect either inside or outside the circle, the rectangle contained by the parts of the one is equal to the rectangle contained by the parts of the other.

PROPORTION : SIMILAR TRIANGLES.

If a straight line is drawn parallel to one side of a triangle, the other two sides are divided proportionally; and the converse.

If two triangles are equiangular, their corresponding sides are proportional; and the converse.

If two triangles have one angle of the one equal to one angle of the other and the sides about these equal angles proportional, the triangles are similar.

The internal bisector of an angle of a triangle divides the opposite sides internally in the ratio of the sides containing the angle, and likewise the external bisector externally.

The ratio of the areas of similar triangles is equal to the ratio of the squares on corresponding sides.

MATHEMATICS.

There will be two papers in Mathematics, one paper in Arithmetic and Algebra, and a second paper in Geometry.

The courses shall be as follows :—

(1) *Arithmetic*.—The whole of Arithmetic. (The use of Algebraical symbols and processes will be permitted.)

(2) *Algebra*.—The four simple rules, Fractions, Greatest Common Measure, Least Common Multiple, Factors, Proportion, Simple Equations of one or more unknown quantities with easy problems, Square Root, simple questions on Fractional and Negative Indices, Quadratic Equations of one unknown quantity with easy problems, easy graphs.

(Candidates will be provided with squared paper.)

(3) *Geometry*.—The course includes both Practical and Theoretical Geometry, and every candidate will be expected to answer questions in both branches of the subject.

The questions on Practical Geometry will be set on the constructions contained in the annexed Schedule A, together with easy extensions of them. All figures should be drawn accurately, for which purpose every candidate should provide himself with a graduated scale, a pair of set squares, a protractor, a compass and a hard pencil.

The questions on Theoretical Geometry will consist of Theorems contained in the annexed Schedule B, together with easy extensions and deductions with numerical illustrations. Any proof of a proposition will be accepted which appears to the Examiners to form part of a systematic treatment of the subject; the order in which the theorems are stated in Schedule B is not imposed as the sequence of their treatment. In the proof of the theorems hypothetical constructions will be permitted.

Schedule A.

Bisections of angles and of straight lines.

Construction of perpendiculars to straight lines.

Construction of an angle equal to a given angle.

Construction of parallels to a given straight line.

Simple cases of the construction from sufficient data of triangles and quadrilaterals.

Division of straight lines into a given number of equal parts or into parts in any given proportions.

Construction of a triangle equal in area to a given polygon.

Construction of tangents to a circle and of common tangents to two circles.

Simple cases of the construction of circles from sufficient data.

Construction of a fourth proportional to three given straight lines and a mean proportional to two given straight lines.

Construction of regular figures of 3, 4, 6 or 8 sides in or about a given circle.

Construction of a square equal in area to a given polygon.

Schedule B.

ANGLES AT A POINT.

If a straight line stands on another straight line, the sum of the two angles so formed is equal to two right angles; and the converse.

If two straight lines intersect, the vertically opposite angles are equal.

PARALLEL STRAIGHT LINES.

When a straight line cuts two other straight lines, if

- (i) a pair of alternate angles are equal, or
- (ii) a pair of corresponding angles are equal, or
- (iii) a pair of interior angles on the same side of the cutting line are together equal to two right angles,

then the two straight lines are parallel ; and the converse.

Straight lines which are parallel to the same straight line are parallel to one another.

TRIANGLES AND RECTILINEAR FIGURES.

The sum of the angles of a triangle is equal to two right angles.

If the sides of a convex polygon are produced in order the sum of the angles so formed is equal to four right angles.

If two triangles have two sides of the one equal to two sides of the other, each to each, and also the angles contained by these sides equal, the triangles are congruent.

If two triangles have two angles of the one equal to two angles of the other, each to each, and also one side of the one equal to the corresponding side of the other the triangles are congruent.

If two sides of a triangle are equal, the angles opposite to these sides are equal ; and the converse.

If two triangles have the three sides of the one equal to the three sides of the other, each to each, the triangles are congruent.

If two right-angled triangles have their hypotenuses equal, and one side of the one equal to one side of the other, the triangles are congruent.

If two sides of a triangle are unequal, the greater side has the greater angle opposite to it; and the converse.

Of all the straight lines that can be drawn to a given straight line from a given point outside it, the perpendicular is the shortest.

The opposite sides and angles of a parallelogram are equal; each diagonal bisects the parallelogram and the diagonals bisect one another.

If there are three or more parallel straight lines and the intercepts made by them on any straight line that cuts them are equal, then the corresponding intercepts on any other straight line that cuts them are also equal.

AREAS.

Parallelograms on the same or equal bases and of the same altitude are equal in area.

Triangles on the same or equal bases and of the same altitude are equal in area.

Equal triangles on the same or equal bases are of the same altitude.

Illustrations and explanations of the geometrical theorems corresponding to the following Algebraical identities:—

$$k(a + b + c + \dots) = ka + kb + kc + \dots$$

$$(a + b)^2 = a^2 + 2ab + b^2.$$

$$(a - b)^2 = a^2 - 2ab + b^2.$$

$$a^2 - b^2 = (a + b)(a - b).$$

The square on a side of a triangle is greater than, equal to, or less than, the sum of the squares on the other two sides, according as the angle contained by those sides is obtuse, right, or acute. The difference in the case of inequality is twice the rectangle contained by one of the two sides and the projection on it of the other.

LOCUS.

The locus of a point which is equidistant from two fixed points is the perpendicular bisector of the straight line joining the two fixed points.

The locus of a point which is equidistant from two intersecting straight lines consists of the pair of straight lines which bisect the angles between the two given lines.

THE CIRCLE.

A straight line drawn from the centre of a circle to bisect a chord which is not the diameter is at right angles to the chord; conversely the perpendicular to a chord from the centre bisects the chord.

There is one circle, and one only, which passes through three given points not in a straight line.

In equal circles (or in the same circle) (i) if two arcs subtend equal angles at the centres, they are equal; (ii) conversely, if two arcs are equal, they subtend equal angles at the centres.

In equal circles (or in the same circle) (i) if two chords are equal, they cut off equal arcs; (ii) conversely, if two arcs are equal the chords of the arcs are equal.

Equal chords in a circle are equidistant from the centre; and the converse.

The tangents at any point of a circle and the radius through the point are perpendicular to one another.

If two circles touch, the point of contact lies on the straight line through the centres.

The angle which an arc of a circle subtends at the centre is double that which it subtends at any point on the remaining part of the circumference.

Angles in the same segment of a circle are equal; and, if the line joining two points subtends equal angles at two other points on the same side of it, the four points lie on a circle.

The angle in a semi-circle is a right angle, the angle in a segment greater than a semi-circle is less than a right angle, and the angle in a segment less than a semi-circle is greater than a right angle.

The opposite angles of any quadrilateral inscribed in a circle are supplementary; and the converse.

If a straight line touch a circle, and from the point of contact a chord be drawn, the angles which this chord makes with the tangent are equal to the angles in the alternate segments.

If two chords of a circle intersect either inside or outside the circle, the rectangle contained by the parts of the one is equal to the rectangle contained by the parts of the other.

PROPORTION : SIMILAR TRIANGLES.

If a straight line is drawn parallel to one side of a triangle, the other two sides are divided proportionally; and the converse.

If two triangles are equiangular, their corresponding sides are proportional; and the converse.

If two triangles have one angle of the one equal to one angle of the other and the sides about these equal angles proportional, the triangles are similar.

The internal bisector of an angle of a triangle divides the opposite sides internally in the ratio of the sides containing the angle, and likewise the external bisector externally.

The ratio of the areas of similar triangles is equal to the ratio of the squares on corresponding sides.

STATE SCHOLARSHIPS TENABLE AT OXFORD OR CAMBRIDGE BY NATIVES OF INDIA.*

RESOLUTION.

In Home Department Resolution No. 360, dated 30th June, 1868, a scheme was promulgated for the creation of a certain number of Government scholarships tenable in England by natives of India. It was explained that the

* 1. These scholarships were instituted by Home Department Resolution No. $\frac{1}{40-41}$, dated the 12th February, 1886, No. $\frac{2}{239-31}$, dated the 23rd August, 1886, and No. $\frac{3}{38-49}$, dated 30th January, 1885.

2. By Government of India Home Department Resolution No. 221/238, dated the 19th March, 1907, a scholarship, tenable in England, for domiciled Europeans and Eurasians has been established. Europeans and Eurasians are therefore not eligible for the University State Scholarship.

object of creating the scholarships was to encourage Natives of India to resort more freely to England for the purpose of perfecting their education and of studying for the various learned professions or for the Civil and other services in India. In a subsequent Resolution, dated 18th January, 1870, the circumstances were set forth under which it had been determined to hold this scheme in abeyance. For some time past the Government of India has been in communication with Her Majesty's Secretary of State regarding the re-establishment of a limited number of Government scholarships tenable in England by Natives of India, and the Governor-General in Council is glad to be able now to announce that it has been decided to bring into immediate operation a scheme which, it is hoped, will have the effect of offering a certain measure of encouragement to the youths of this country to proceed to England for the purpose of completing their education either at the University of Oxford or at the University of Cambridge.

2. Six scholarships, the cost of which will be defrayed by the Government of India, will be at once established, tenable in England by persons who are Natives of India within the meaning of Section 6 of the Statute 33 Vic., Cap. 3. The scholarships will be placed at the disposal of the Universities of Calcutta, Bombay, Madras and the Punjab in rotation,* one scholarship being given to each of the first two Universities during the present year (1886), and one scholarship to each of the

* Under Resolution, dated 17th October, 1888, consequent upon the establishment of the Allahabad University, the Government of India has decided that, with effect from the year 1889, each of the Universities concerned shall participate in the scholarships in the following sequence :—

last two during next year '1887'. In allotting the scholarships in future years, the same order will be observed.

3. Each scholarship will entitle the holder to an allowance, not exceeding £200 *per annum*, payable from the date of his arrival in England, and will be tenable for *three years*. No candidate should be more than 21 years of age. Each candidate to whom a scholarship may be awarded will be required to proceed to England within a reasonable period from the date of his selection, and to reside there for a period of *three years*, unless compelled to return sooner by ill-health.

4. Each scholar will be entitled to receive a sum of £100* for passage-money, and a similar sum will be payable within one month before his actual return to India if he should complete the full period of *three years* residence, or be compelled by sickness to return before the completion of that period.

5. It is intended to reserve to the scholars the power of selecting once for all the course of study to be followed by them in England. Each scholar will be required to bind himself by written engagement to submit to such regulations as may, from time to time, be framed by Her Majesty's Secretary of State for the guidance of scholars.

6. If any scholar, not being disabled by sickness, fails to complete a residence of three years in England or is guilty of gross misconduct or disregard of the orders of Her Majesty's Secretary of State, he will, at the discretion of the Secretary of State, forfeit his scholarship and further be liable to refund the sum drawn by him as passage-money.

7. Scholars will be expected to reach England before the opening of the October term at the University of Oxford or Cambridge, to one of which University they will be required to proceed.

* By Resolution of Government of India, dated 2nd February, 1895, it is notified that, in future, Second Class accommodation only by Railway in India, and on the sea-voyage to London, will be allowed to persons selected to hold State Scholarships tenable in England.

CAMBRIDGE UNIVERSITY.

Report of the Council of the Senate on the Affiliation of
the University of Allahabad; confirmed by the
Senate on 21st November, 1895, as per letter dated
Cambridge, 29th June, 1896.

21st October 1895.

THE COUNCIL OF THE SENATE beg leave to report to the
SENATE as follows:—

In course of last year the Vice-Chancellor received
from the Registrar of the University of Allahabad an
application for the affiliation of that University to the
University of Cambridge.

The Council have found that the constitution and
scheme of examinations of the University of Allahabad
closely resemble those of the University of Calcutta. and
that the two Universities recognise each other on equal
terms, the Examinations and degrees of the one being
accepted as equivalent by the other. The Council there-
fore decided that they would be prepared to recommend

to the Senate that the application for affiliation be granted on terms similar to those approved by Grace J of 5th March, 1895, for the University of Calcutta; and they communicated with the authorities of the University of Allahabad to this effect. They have now received an acceptance on the part of that University of the terms proposed.

The Council accordingly recommend—

1. That the University of Allahabad be adopted as an institution affiliated to the University of Cambridge.

2. That any matriculated student of the University of Allahabad be entitled to be admitted to the privileges of affiliation who has (1) in accordance with the regulations of that University studied for not less than two years at one or more Institutions for the education of adult students affiliated in Arts up to the B.A. standard; (2) passed the Entrance Examination, and also passed in the First Division in the Intermediate Examination in Arts or in the First or Second Division in the Examination for the Degree of Bachelor of Arts of that University: provided that in one of these Examinations or in some other Examination held by that University he has satisfied the Examiners in Greek, Latin, Sanskrit, Arabic or Persian.

ST. JOHN'S COLLEGE, AGRA.

AFFILIATED IN ARTS, 1888, 1890, 1893; IN LAW, 1891;
and IN SCIENCE, 1903

This College was established in 1850, and its foundation was chiefly due to the efforts of an influential body of Civilians and Military Officers, who were at that time members of the Local Committee of the Church Missionary Society; the Hon'ble J. R. Colvin, Lieutenant-Governor of the N.-W.P., being the Patron, and Sir William Muir, the President.

Their desire was to found a College for the education of the higher classes of Indian youths upon strictly Christian

principles, as they felt that such an institution was greatly needed in order to create a higher moral and spiritual tone among those classes.

In more recent years, owing to the rapid growth of the Indian Christian community, the object of the institution has become somewhat changed. Whilst welcoming, as before, all Hindus and Muhammadans desirous of receiving a liberal education under Christian influences, the College has become recognised more specially as an institution where the education of Indian Christian youth is made a matter of primary importance. The following High Schools of the Church Missionary Society are affiliated to St. John's College, *viz.* :—

1. Robert Money Institution, Bombay.
2. St. John's Collegiate School, Agra.
3. Church Mission High School, Azamgarh.
4. " " " " Basti.
5. " " " " Jaunpur.
6. " " " " Jhalpur.
7. " " " " Lucknow.
8. " " " " Meerut.
9. Jai Narain's College, Benares.

The Christian students of these schools are eligible for various scholarships and other concessions, according to merit and circumstances.

The buildings and conveniences have been considerably increased in recent years. They consist of the College; the School; Hostels for Christians and Hindus; a College-chapel; a swimming bath, etc. The College consist of three sections, *viz.* :—

I.—An aided College Department which receives a grant-in aid of Rs. 500 per mensem from Provincial Funds with classes in Arts, Science, and Law.

II.—A School Department, including a School-Final Class, which receives a grant-in-aid of Rs. 400 per month from Government.

The fees are according to the scale of the Education Department, United Provinces of Agra and Oudh, for Aided Schools.

III.—A Business Department, with Classes in Shorthand, Type-writing, Drawing, Book keeping, Precis, Composition, Drafting, Methods of Official Procedure, etc., with a view to practical training for Government and the public services.

CHRISTIAN COLLEGE, ALLAHABAD.

AFFILIATED ARTS, 1903, 1905 AND 1903; IN SCIENCE, 1905.

In October, 1846, the British East India Company transferred its College work at Allahabad to the American Pres-

byterian Mission. When the British Civil Station was removed from the Jumna in 1853, the Mission purchased the Court building for educational purposes for the sum of Rs. 6,000. The institution was in the beginning a Collegiate School. After a few years College classes were abolished and School classes alone continued, the institution being known as the Jumna Mission School.

In 1900 the American Presbyterian Mission decided to reopen College work at Allahabad, and the First class was begun in 1902. In order to keep School and College separate the old Court building was demolished and a new School building erected at the western end of the Jumna compound, thus leaving the eastern end free for the College buildings and campus.

The eastern end now contains three bungalows, one of which is used as a Hostel, a Laboratory, a new two-storeyed Hostel, and a special student building erected by the Alumni of Princeton University, which contains a students' common room, a Reading Room and Library, a suite of rooms for a Professor and a number of students' rooms. The main College building is being erected. Seven members of the staff live on the compound.

The number of students in 1905-06 was 102.

This institution was opened as a High School in 1884 by the Central India Mission of the Presbyterian Church in Canada. In 1888 it was affiliated with the University of Calcutta as far as the F.A. Standard, and raised in 1893 to the B.A. Standard. By the conditions of the Indian Universities Act of 1904 it was brought within the jurisdiction of Allahabad, and in 1905 was affiliated with this University.

All College and High School classes are held in the main building, a two-storeyed edifice built under the late Principal, Rev. Dr. Wilkie. It is situated within the Residency limits and surrounded by its own grounds.

The Hostel contains between thirty and forty single rooms. These can be secured at a nominal rental of eight annas per mensem. A Hindu mess club, with Brahman cooks, has been running for some years.

A Christian Hostel, distinct from the above, has been opened under the supervision of a Christian Master.

The Library, Reading and Recreation Rooms are well equipped. The regulations are such that students have opportunity of wide reading.

The institution consists of three sections—

- (1) An unaided College Department;
- (2) A School Department, including a School-Final class, which receives a grant-in-aid of Rs. 160 per mensem from Local Funds;
- (3) A Business Department with classes in Short-hand and Type-writing.

MATRICULATION, 1911.

TEXT-BOOKS AND SYALLABUS PRESCRIBED FOR THE EXAMINATIONS OF 1911.

MATRICULATION EXAMINATION.

ENGLISH.

Three papers will be set. One paper will be set from the prescribed course in Prose and Poetry with questions on Grammar and Idiom. A second paper will be set on 'unseen' passages with questions on Grammar and Idiom. The 'unseen' passages will be of the standard of the books named below and may be chosen from them. In the third paper, passages in an Indian vernacular (Urdu, Hindi, Mahratti, Gujrati, Bengali, Parbatia, Tamil, Telugu, Uriya) will be set for translation into English: but for such translation there will be substituted English Composition in the case of any candidate whose mother-tongue is English.

Books prescribed :—

PROSE :—

WASHINGTON IRVING: Rip Van Winkle and the Legend of the Sleepy Hollow.

POETRY :—

HEBER: Evening on the Ganges.

MRS. HEMANS: Leaves have their time to fall.

POPE: Ode on Solitude.

CAMPION: The Man of Life Upright.

CAMPBELL: Hohenlinden.

WORDSWORTH: The World is too much with us.

BRYANT: Ode to a Waterfowl.

Books indicating the standard for passages to be set in the second paper :—

GREEN: Readings from English History, Part III.

SCOTT: Ivanhoe.

KINGSLEY: Heroes.

LAMB: Tales from Shakespeare.

MATHEMATICS.

There will be two papers in Mathematics, one paper in Arithmetic and Algebra, and a second paper in Geometry.

The courses shall be as follows :—

(1) *Arithmetic*.—The whole of Arithmetic. (The use of Algebraical symbols and processes will be permitted.)

(2) *Algebra*.—The four simple rules, Fractions, Greatest Common Measure, Least Common Multiple, Factors, Proportion, Simple Equations of one or more unknown quantities with easy problems, Square Root, simple questions on Fractional and Negative Indices, Quadratic Equations of one unknown quantity with easy problems, easy graphs.

(Candidates will be provided with squared paper.)

(3) *Geometry*.—The course includes both Practical and Theoretical Geometry, and every candidate will be expected to answer questions in both branches of the subject.

The questions on Practical Geometry will be set on the constructions contained in the annexed Schedule A, together with easy extensions of them. All figures should be drawn accurately, for which purpose every candidate should provide himself with a graduated scale, a pair of set squares, a protractor, a compass and a hard pencil.

The questions on Theoretical Geometry will consist of Theorems contained in the annexed Schedule B, together with easy extensions and deductions with numerical illustrations. Any proof of a proposition will be accepted which appears to the Examiners to form part of a systematic treatment of the subject: the order in which the theorems are stated in Schedule B it is not imposed as the sequence of their treatment. In the proof of the theorems hypothetical constructions will be permitted.

Schedule A.

Bisections of angles and of straight lines.

Construction of perpendiculars to straight lines.

Construction of an angle equal to a given angle.

Construction of parallels to a given straight line.

Simple cases of the construction from sufficient data of triangles and quadrilaterals.

Division of straight lines into a given number of equal parts or into parts in any given proportions.

Construction of a triangle equal in area to a given polygon.

Construction of tangents to a circle and of common tangents to two circles.

Simple cases of the construction of circles from sufficient data.

Construction of a fourth proportional to three given straight lines and a mean proportional to two given straight lines.

Construction of regular figures of 3, 4, 6 or 8 sides in or about a given circle.

Construction of a square equal in area to a given polygon.

Schedule B.

ANGLES AT A POINT.

If a straight line stands on another straight line, the sum of the two angles so formed is equal to two right angles; and the converse.

If two straight lines intersect, the vertically opposite angles are equal.

PARALLEL STRAIGHT LINES.

When a straight line cuts two other straight lines, if

(i) a pair of alternate angles are equal, or

- (ii) a pair of corresponding angles are equal, or
- (iii) a pair of interior angles on the same side of the cutting line are together equal to two right angles

then the two straight lines are parallel; and the converse.

Straight lines which are parallel to the same straight line are parallel to one another.

TRIANGLES AND RECTILINEAL FIGURES.

The sum of the angles of a triangle is equal to two right angles.

If the sides of a convex polygon are produced in order the sum of the angles so formed is equal to four right angles.

If two triangles have two sides of the one equal to two sides of the other, each to each, and also the angles contained by these sides equal, the triangles are congruent

If two triangles have two angles of the one equal to two angles of the other, each to each, and also one side of the one equal to the corresponding side of the other, the triangles are congruent.

If two sides of a triangle are equal, the angles opposite to these sides are equal; and the converse.

If two triangles have the three sides of the one equal to the three sides of the other, each to each, the triangles are congruent.

If two right-angled triangles have their hypotenuses equal, and one side of the one equal to one side of the other, the triangles are congruent.

If two sides of a triangle are unequal, the greater side has the greater angle opposite to it; and the converse.

Of all the straight lines that can be drawn to a given straight line from a given point outside it, the perpendicular is the shortest.

The opposite sides and angles of a parallelogram are equal; each diagonal bisects the parallelogram and the diagonals bisect one another.

If there are three or more parallel straight lines and the intercepts made by them on any straight line *also* cuts them are equal, then the corresponding intercepts on any other straight line that cuts them are also equal.

AREAS.

Parallelograms on the same or equal bases and of the same altitude are equal in area.

Triangles on the same or equal bases and of the same altitude are equal in area.

Equal triangles on the same or equal bases are of the same altitude.

Illustrations and explanations of the geometrical theorems corresponding to the following Algebraical identities:—

$$k(a + b + c + \dots) = ka + kb + kc + \dots$$

$$(a + b)^2 = a^2 + 2ab + b^2.$$

$$(a - b)^2 = a^2 - 2ab + b^2.$$

$$a^2 - b^2 = (a + b)(a - b).$$

The square on a side of a triangle is greater than, equal to, or less than, the sum of the squares on the other two sides, according as the angle contained by those sides is obtuse, right, or acute. The difference in the case of inequality is twice the rectangle contained by one of the two sides and the projection on it of the other.

LOCUS.

The locus of a point which is equidistant from two fixed points is the perpendicular bisector of the straight line joining the two fixed points.

The locus of a point which is equidistant from two intersecting straight lines consists of the pair of straight lines which bisect the angles between the two given lines.

THE CIRCLE.

A straight line drawn from the centre of a circle to bisect a chord which is not the diameter is at right angles to the chord; conversely the perpendicular to a chord from the centre bisects the chord.

There is one circle, and one only, which passes through three given points not in a straight line.

In equal circles (or in the same circle) (i) if two arcs subtend equal angles at the centres, they are equal; (ii) conversely, if two arcs are equal, they subtend equal angles at the centres.

In equal circles (or in the same circle) (i) if two chords are equal, they cut off equal arcs; (ii) conversely, if two arcs are equal the chords of the arcs are equal.

Equal chords in a circle are equidistant from the centre; and the converse.

The tangents at any point of a circle and the radius through the point are perpendicular to one another.

If two circles touch, the point of contact lies on the straight line through the centres.

The angle which an arc of a circle subtends at the centre is double that which it subtends at any point on the remaining part of the circumference.

Angles in the same segment of a circle are equal; and, if the line joining two points subtends equal angles at two other points on the same side of it, the four points lie on a circle.

The angle in a semi-circle is a right angle, the angle in a segment greater than a semi-circle is less than a right angle, and the angle in a segment less than a semi-circle is greater than a right angle.

The opposite angles of any quadrilateral inscribed in a circle are supplementary; and the converse.

If a straight line touch a circle, and from the point of contact a chord be drawn, the angles which this chord makes with the tangent are equal to the angles in the alternate segments.

If two chords of a circle intersect either inside or outside the circle, the rectangle contained by the parts of the one is equal to the rectangle contained by the parts of the other.

PROPORTION : SIMILAR TRIANGLES.

If a straight line is drawn parallel to one side of triangle, the other two sides are divided proportionally and the converse.

If two triangles are equiangular, their corresponding sides are proportional; and the converse.

If two triangles have one angle of the one equal to one angle of the other and the sides about these equal angles proportional, the triangles are similar.

The internal bisector of an angle of a triangle divides the opposite sides internally in the ratio of the sides containing the angle and likewise the external bisector externally.

The ratio of the areas of similar triangles is equal to the ratio of the squares on corresponding sides.
